INTEGRATED PEST MANAGEMENT

OUR COMMITMENT,
OUR LAND.

Over the course of more than a century of history, we have always chosen to operate in respect of the environment and our workers.

For us, taking care of the land, preserving it and sustaining it, is the only possible approach to our work.

SQNPI

Integrated Pest Management

The company decided to adopt the procedural guidelines of Integrated Pest Management of the Marche Region, a protocol for cultivation that is respectful of the environment and people. In 2019, we obtained the SQNPI Quality Certification issued by the MIPAAF Ministry

These procedural guidelines limit use of PPP (Plant Protection Products) and forbid the use of chemical substances considered harmful to health. The goal is to protect our production from parasite attacks while safeguarding the surrounding environment.

Some of the agronomic practices and defense techniques allowed:

- Fertilizing with organic substances.
- Techniques of sexual confusion to remove parasites.
- Hedges and stone walls to enrich the vineyard ecosystem.

The main advantages of Integrated Production:

- Environmental sustainability.
- Low environmental impact and optimum production yield.
- Safe and good crops for human health.
- In the long term increased resistance to problem-causing agents.

Certification provides for a system of dual control on the part of the company as well as organisms authorized by MIPAAF that guarantee traceability all along the production chain, from the grapes to the bottle.
